

Name | Isau Sarawak
Country | Malaysia

Registration date:

22/01/2013

Expiry date:

22/01/2023

Source: myipo.gov.my

Main characteristics/features

Isau or green longan (*Dimocarpus longan* var. *malesianus*) is from the family of sapindaceae. Isau is special compared to other types of longan because of its distinct colour and appearance.

The fruit is dark green and spherical, with numerous protuberances on the surface of its skin. As it ripens, the colour changes to a light yellowish-green and its protuberances flatten slightly to give it a smooth appearance.

Geographical area

The geographical area is located in the Sarawak region of Malaysia (Borneo).

Production and processing

Isau trees are medium-sized in height and have a perennial growing period. Unlike other types of longan, the Isau tree takes longer to bear fruit, anything from 8 to 10 years. Therefore, the Isau is considered as belonging to the group of fruits that have a long juvenile period.

Link between product and territory

The Isau tree grows naturally on the fertile alluvial soils of the upper river in the Rejang basin. These natural conditions give the fruit their specificity.
