

Name : Hường Sơn Antler
Country : Viet Nam

Date of registration:
28/02/2019

Source: www.noip.gov.vn

Main characteristics/features

Raw Hường Sơn antler has pink colour and the minimum weight of 400g per pair. Dried Hường Sơn antler has brown or gold colour and the weight of 1/3 of raw antler's. The contents of protein, micro-minerals and amino acids are significantly higher than that of Nghệ An and Quảng Bình antler

Geographical area

32 communes and towns of Hường Sơn district, Hà Tĩnh province.

Production and processing

The stags are indigenous stags with transparent profile from reputed farms and not inbred. Stags in the geographical area are confined or semi-free ranged. They are fed mainly with raw feed and limited carbohydrate feed. 1 – 2 months before antler shedding, stags shall be fed with mixed weeds and leaves, mainly resin-rich plants. Antlers are cut 45 – 55 days after shedding. Antlers are then cleaned and stored by either freezing or drying method.

Link between product and territory

The distinctive climate and soil of the geographical area ensure the abundant, nutritious and healthy feed for the stags. Stags' feeds in the area consists mainly of natural plants, especially those rich in resin which contains high protein and fiber content, allowing a significantly higher level of amino acid in Hường Sơn antler comparing to those of other regions.
