#### Main characteristics/features

#### Geographical area

“Khả Lĩnh” pomelo has spherical shape with flat top and bottom. The pedicel is small and shallow. The fruit skin is very thin at 3.8 mm to 8.7 mm, which turns yellow, smooth and shiny when ripe. The rind is white, the pulps are consistent and juice with water content from 85.67 % to 89.82 %. The essence oil content in the skin is high at 1.48% to 1.71 %, with 44 to 51 oil pouches per cm<sup>2</sup>, resulting in the aroma of the pomelo. “Khả Lĩnh” pomelo has high Brix degree at 11.03 % to 12,75 %, total sugar content at 9.48 % to 10,71 %. Therefore, it has a slightly sweet taste with no acidity and sourness.

Đại Minh commune, Yên Bình district, Yên Bái province

#### Production/processing

#### Link between product and territory

Techniques such as cross insemination with sour pomelo, sensible use of organic fertilizers, selecting saplings from high quality mother trees to improve the productivity, protect and make use of the genetic features of Khả Lĩnh pomelo.

The hydrology of the area is determined by the Chảy river system, Thác Bà lake and a system of rivers, streams, ditches, and canals, therefore the soil in the area is always added with alluvium, loose and ventilated with good drainage. Thus, the soil can avoid floods and salinification. Soluble phosphorus content is high at 174.26 mg/kg to 188.63 mg/kg which helps lower the total acidic content in fruit juice resulting in less sour taste. Total potassium content is from 1.18 % to 1.25 %, and soluble potassium is high at 140.24 mg/kg to 154.10 mg/kg which heightens the Brix degree, sugar content in fruit juice and lowers the skin thickness. Moreover, cation exchange capacity (CEC) in the soil is high from 41.38 meq/100g to 45.08 meq/100g, which help the plant absorbs potassium better, resulting in improved Brix degree.
